

ABSTRACT

A display pack includes a plate for supporting and retaining a greater tool member, such as wrenches, screw drivers, or plier devices. The plate includes a number of cavities formed in such as 5 blocks to receive a number of smaller tool elements, such as screw driver bits, sockets. A retaining device may be used to retain the smaller tool elements in the cavities of the plate, and includes one or more bars for limiting the movement of the tool elements relative to the plate, and for retaining the tool elements in the cavities of the 10 plate. The bars include a number of apertures to partially receive the tool elements.
